

# High-stability Gyro Sensor: XV7081BB

## Features

- Excellent bias stability over temperature  
0.0024 (°/s)/°C Typ.
- Low angular random walk 0.065 °/√h Typ.
- SPI/I<sup>2</sup>C serial interface
- Integrated user-selectable digital filter
- Angular rate output (16 or 24 bits resolution)
- Embedded temperature sensor
- Wide supply voltage range 2.7 to 3.6 V
- Low power consumption 0.9 mA Typ.
- Rate range ±400 °/s

## Applications

- Anti-vibration, attitude control for industrial applications
- Autonomous machines
- Robotics control
- Optical image stabilization
- Motion detection for human machine interface

## Typical Performance

Figure. Bias Variation over Temperature

Figure. Allan Variance

## Description

The XV7081BB has superior performance characteristics especially with bias output stability and low noise while consumption less than 1 mA of current. Epson achieves these performances by using Epson's original quartz sensor element.

This sensor has digital output interface (SPI and I<sup>2</sup>C) that is compatible with various interface logic levels enabled by interface power supply voltage settings (V<sub>DDI</sub>) that are independent of the main power supply voltage (V<sub>DDM</sub>).

In addition, user-selectable low-pass filters and high-pass filters are available for wide range of cut-off frequencies. The XV7081 is suitable for various applications from consumer electronics such as wearable devices to industrial equipment.

1. The content of this document is subject to change without notice. Before purchasing or using Epson products, please contact with sales representative of Seiko Epson Corporation ("Epson") for the latest information and be always sure to check the latest information published on Epson's official web sites and resources.
2. This document may not be copied, reproduced, or used for any other purposes, in whole or in part, without Epson's prior consent.
3. Information provided in this document including, but not limited to application circuits, programs and usage, is for reference purpose only. Epson makes no guarantees against any infringements or damages to any third parties' intellectual property rights or any other rights resulting from the information. This document does not grant you any licenses, any intellectual property rights or any other rights with respect to Epson products owned by Epson or any third parties.
4. Using Epson products, you shall be responsible for safe design in your products; that is, your hardware, software, and/or systems shall be designed enough to prevent any critical harm or damages to life, health or property, even if any malfunction or failure might be caused by Epson products. In designing your products with Epson products, please be sure to check and comply with the latest information regarding Epson products (including, but not limited to this document, specifications, data sheets, manuals, and Epson's web site). Using technical contents such as product data, graphic and chart, and technical information, including programs, algorithms and application circuit examples under this document, you shall evaluate your products thoroughly both in stand-alone basis and within your overall systems. You shall be solely responsible for deciding whether to adopt/use Epson products with your products.
5. Epson has prepared this document carefully to be accurate and dependable, but Epson does not guarantee that the information is always accurate and complete. Epson assumes no responsibility for any damages you incurred due to any misinformation in this document.
6. No dismantling, analysis, reverse engineering, modification, alteration, adaptation, reproduction, etc., of Epson products is allowed.
7. Epson products have been designed, developed and manufactured to be used in general electronic applications and specifically designated applications ("Anticipated Purpose"). Epson products are NOT intended for any use beyond the Anticipated Purpose that requires particular quality or extremely high reliability in order to refrain from causing any malfunction or failure leading to critical harm to life and health, serious property damage, or severe impact on society, including, but not limited to listed below ("Specific Purpose"). Therefore, you are strongly advised to use Epson products only for the Anticipated Purpose.  
Should you desire to purchase and use Epson products for Specific Purpose, Epson makes no warranty and disclaims with respect to Epson products, whether express or implied, including without limitation any implied warranty of merchantability or fitness for any Specific Purpose. Please be sure to contact our sales representative in advance, if you desire Epson products for Specific Purpose:  
Space equipment (artificial satellites, rockets, etc.)/Transportation vehicles and their control equipment (automobiles, aircraft, trains, ships, etc.)/Medical equipment/Relay equipment to be placed on sea floor/ Power station control equipment/Disaster or crime prevention equipment/Traffic control equipment/Financial equipment  
Other applications requiring similar levels of reliability as the above
8. Epson products listed in this document and our associated technologies shall not be used in any equipment or systems that laws and regulations in Japan or any other countries prohibits to manufacture, use or sell. Furthermore, Epson products and our associated technologies shall not be used for the purposes of military weapons development (e.g. mass destruction weapons), military use, or any other military applications. If exporting Epson products or our associated technologies, please be sure to comply with the Foreign Exchange and Foreign Trade Control Act in Japan, Export Administration Regulations in the U.S.A (EAR) and other export-related laws and regulations in Japan and any other countries and to follow their required procedures.
9. Epson assumes no responsibility for any damages (whether direct or indirect) caused by or in relation with your non-compliance with the terms and conditions in this document or for any damages (whether direct or indirect) incurred by any third party that you give, transfer or assign Epson products.

### 1. Block Diagram

The block diagram of the sensor is shown in Figure 1.1 and Figure 1.2.

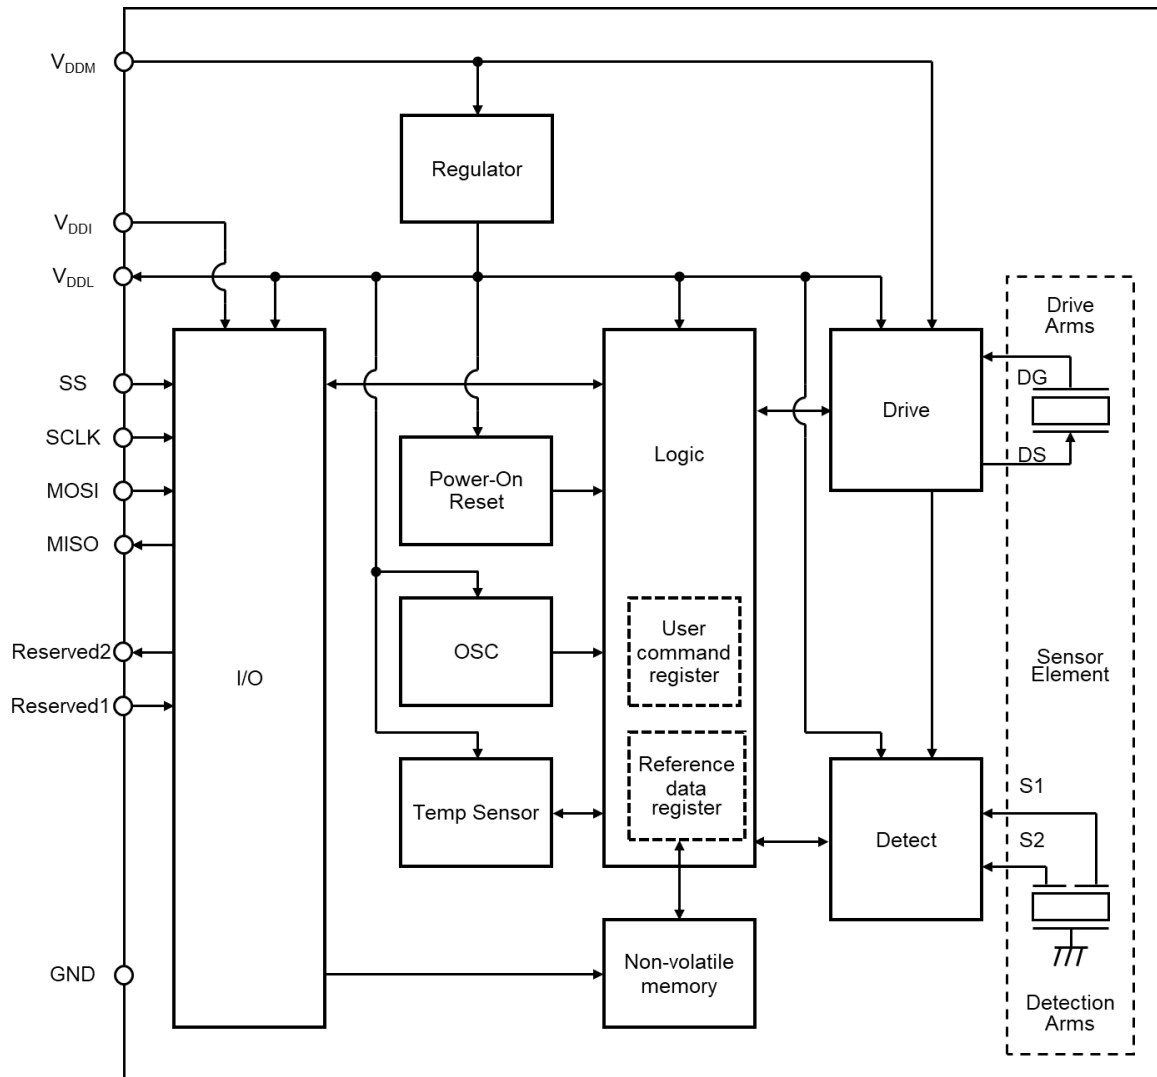

Figure 1.1. Functional Block Diagram

Figure 1.2. Block Diagram of Detecting Part

## 2. Functional Explanation

### 2.1. Detecting Axis and Output Polarity

This product detects an angular rate of a rotational movement. The correlation between a detecting axis of the angular rate and an output polarity is shown in Figure 2.1.

Figure 2.1. Detecting Axis and Output Polarity

### 2.2. Interface

This product is compatible with SPI (4-wire, 3-wire) and I<sup>2</sup>C. Available only in SPI 4-wire mode expansion function, this sensor includes a multi-slave function for use in systems that detect two or more axes at once. This makes it possible to reduce I/O ports and board circuitry. This sensor allows for interface power supply voltage settings ( $V_{DDI}$ ) that are independent of the power supply voltage ( $V_{DDM}$ ) to enable communications with interfaces of various logic levels. The multi-slave function is available only through factory settings implemented by Epson.

### 2.3. Angular Rate Output

The angular rate output data is provided in a 2's complement format. 16 bits or 24 bits can be selected from the register settings. The AD converter sample rate is 13.770 kHz at frequency code H, L and 14.160 kHz at frequency code J. The angular rate output data can also be provided after processing through the low-pass filter (LPF) or the high-pass filter (HPF).

LPF: This is a 2<sup>nd</sup>, 3<sup>rd</sup> or 4<sup>th</sup> order filter, the cutoff frequency can be selected from the following 14 stages.  
(10, 35, 45, 50, 70, 85, 100, 140, 175, 200, 285, 345, 400, 500 Hz)

HPF: This is a 1<sup>st</sup> order filter. When enabled, the cutoff frequency can be selected from the following 7 stages.  
(0.01, 0.03, 0.1, 0.3, 1, 3, 10 Hz)

### 2.4. Temperature Sensor Output

Temperature output data is provided in a 2's complement format. 8 bits, 10 bits or 12 bits can be selected from the register settings.

### 3. Electrical Characteristics

#### 3.1. Absolute Maximum Ratings

Table 3.1. Absolute Maximum Ratings

Parameter	Symbol	Min.	Typ.	Max.	Unit	Condition
Supply voltage	V <sub>DDM</sub>	-0.3	-	+4.0	V	GND = 0 V
Supply voltage for interface	V <sub>DDI</sub>	-0.3	-	+4.0	V	GND = 0 V
Storage temperature	T <sub>STG</sub>	-40	-	+85	°C	
Condition for soldering	-	350 °C, 3 s			-	

#### 3.2. Operating Conditions

Table 3.2. Operating Conditions

Parameter	Symbol	Min.	Typ.	Max.	Unit	Condition
Supply voltage	V <sub>DDM</sub>	2.7	-	3.6	V	GND = 0 V
Supply voltage for interface	V <sub>DDI</sub>	1.65	-	3.6	V	GND = 0 V
Operating temperature	T <sub>OPR</sub>	-20	-	+80	°C	
Supply voltage start up time	t <sub>PU</sub>	0.01	-	100	ms	V <sub>DDM</sub> 0 % to 90 %
4-wire SPI clock frequency	f <sub>SCLK</sub>	-	-	10	MHz	V <sub>DDI</sub> > 2.4 V
4-wire SPI clock frequency	f <sub>SCLK</sub>	-	-	5	MHz	V <sub>DDI</sub> ≤ 2.4 V
3-wire SPI clock frequency	f <sub>SCLK</sub>	-	-	5	MHz	
I <sup>2</sup> C clock frequency	f <sub>SCL</sub>	-	-	400	kHz	
Sampling frequency	f <sub>s</sub>	-	13.770	-	kHz	Frequency code: H, L
		-	14.160	-	kHz	Frequency code: J

(Note 1) Using the drive frequency integral multiplier as communications clock may result in fluctuations in the angular rate output.

(Note 2) Acquiring angular rate data as a frequency that is a fraction of the integer for the drive frequency can result in fluctuations in the angular rate output.

#### 3.3. DC Characteristics

Table 3.3. DC Characteristics

V<sub>DDM</sub> = 2.7 V to 3.6 V, V<sub>DDI</sub> = 1.65 V to 3.6 V, GND = 0 V, T<sub>OPR</sub> = -20 °C to +80 °C

Parameter	Symbol	Min.	Typ.	Max.	Unit	Condition
Logic input voltage	V <sub>IH</sub>	V <sub>DDI</sub> × 0.7	-	-	V	
	V <sub>IL</sub>	-	-	V <sub>DDI</sub> × 0.3	V	
Logic output voltage	V <sub>OH</sub>	V <sub>DDI</sub> - 0.4	-	-	V	V <sub>DDI</sub> = Min., Load = +1 mA
	V <sub>OL</sub>	-	-	0.4	V	V <sub>DDI</sub> = Min., Load = -1 mA

3.4. Operating Sequence at Start-Up

Table 3.4. Operating Sequence at Start-Up

$V_{DDM} = 2.7\text{ V to }3.6\text{ V}$ ,  $V_{DDI} = 1.65\text{ V to }3.6\text{ V}$ ,  $GND = 0\text{ V}$ ,  $T_{OPR} = -20\text{ }^{\circ}\text{C to }+80\text{ }^{\circ}\text{C}$

Parameter	Symbol	Condition	Min.	Typ.	Max.	Unit
Serial communication wait time	$t_{IF}$	-	1	-	-	ms
Temperature sensor data read start time	$t_{TSEN}$	-	-	-	80	ms
Start-up time	$t_{STA}$	Output code $\pm 1\text{ }^{\circ}/\text{s}$	-	-	200	ms

- (Note 1) Conduct serial communication after  $t_{IF}$ .
- (Note 2) Conduct temperature sensor data acquisition after  $t_{TSEN}$ .
- (Note 3) Conduct angular rate data acquisition after  $t_{STA}$ .

Figure 3.1. Operating Sequence at Start-Up

3.5. Gyro Sensor Characteristics

Table 3.5. Gyro Sensor Characteristics

Unless otherwise specified, V<sub>DDM</sub> = 2.7 V to 3.6 V, V<sub>DDI</sub> = 1.65 V to 3.6 V, GND = 0 V, T<sub>OPR</sub> = -20 °C to +80 °C

Parameter	Symbol	Condition	Min.	Typ.	Max.	Unit
Drive frequency	F <sub>d</sub>	Frequency code: H	49.000	49.575	50.150	kHz
		Frequency code: J	50.450	51.025	51.600	kHz
		Frequency code: L	52.900	53.550	54.200	kHz
Detuning frequency	D <sub>f</sub>		0.7	0.9	1.1	kHz

Standby current	I <sub>op2</sub>		-	160	340	μA
Sleep current	I <sub>op3</sub>		-	3	25	μA
Noise density	N <sub>d</sub>	@ 10 Hz, LPF default setting	-	0.0015	-	(°/s)/√Hz
Angular random walk	N		-	0.065	-	°/√h

## 3.6. Temperature Sensor Characteristics

Table 3.6. Temperature Sensor Characteristics

Unless otherwise specified,  $V_{DDM} = 2.7\text{ V to }3.6\text{ V}$ ,  $V_{DDI} = 1.65\text{ V to }3.6\text{ V}$ ,  $GND = 0\text{ V}$ ,  $T_{OPR} = -20\text{ }^{\circ}\text{C to }+80\text{ }^{\circ}\text{C}$ 

Parameter	Symbol	Condition	Min.	Typ.	Max.	Unit
Output code	$T_{out}$	8 bits mode, $T_a = +25\text{ }^{\circ}\text{C}$	20	25	30	LSB
		10 bits mode, $T_a = +25\text{ }^{\circ}\text{C}$	80	100	120	
		12 bits mode, $T_a = +25\text{ }^{\circ}\text{C}$	320	400	480	
Temperature output accuracy	$T_{acc}$	$T_a = +25\text{ }^{\circ}\text{C}$	-5	-	+5	$^{\circ}\text{C}$
Temperature coefficient	$T_{sen}$	8 bits mode	0.9	1.0	1.1	LSB/ $^{\circ}\text{C}$
		10 bits mode	3.6	4.0	4.4	
		12 bits mode	14.4	16.0	17.6	

## 4. Dimensions and Pin Description

### 4.1. Outline Dimensions

Unit: mm

Figure 4.1. Outline Dimensions

### 4.2. Pin Name and Description

Table 4.1. Pin Name and Description

Pin number.	Pin name	Input/Output	Pin description
#1	MOSI/SDA	Input/Output	4-wire SPI communications mode: serial data input 3-wire SPI communications mode: serial data input/output I <sup>2</sup> C communications mode: serial data input/output
#2	SS	Input	4-wire SPI communications mode: slave select 3-wire SPI communications mode: slave select I <sup>2</sup> C communications mode: connect to V <sub>DDI</sub> .
#3	V <sub>DDL</sub>	Output	Internal regulator voltage output Connect to the bypass capacitor 1μF.
#4	Reserved1	Input	Connect to GND.
#5	GND	-	GND
#6	V <sub>DDM</sub>	-	Power supply voltage
#7	Reserved2	Output	Logic "L" level output Do not connect.
#8	V <sub>DDI</sub>	-	Power supply voltage for digital interface
#9	MISO/SA0	Input/Output	4-wire SPI communications mode: serial data output 3-wire SPI communications mode: Do not connect. I <sup>2</sup> C communications mode: select lowest bit of slave address Default status set to pull down (approx. 100 kΩ).
#10	SCLK/SCL	Input	Serial clock (4-wire, 3-wire and I <sup>2</sup> C)

4.3. Marking Description

Frequency code	Drive frequency	Custom recognition	Slave address
H	49.600 kHz	C	01
J	51.000 kHz	D	10
L	53.600 kHz	E	11

Figure 4.2. Marking Description

4.4. Pin Equivalent Circuits

An equivalent circuit for SS, SCLK, MOSI, MISO and Reserved2 is shown in Figure 4.3.

Figure 4.3. The Equivalent Circuit: SS, SCLK, MISO and Reserved2

An equivalent circuit for VDDL and Reserved1 is shown in Figure 4.4.

Figure 4.4. The Equivalent Circuit: VDDL and Reserved1

An equivalent circuit for  $V_{DDM}$  and  $V_{DDI}$  is shown in Figure 4.5.

## 6. Serial Interface

Access to the sensor is accomplished via serial communication. There are three methods for the serial interface: 4-wire SPI, 3-wire SPI or I<sup>2</sup>C.

4-wire SPI communication is enabled by turning on the power supply V<sub>DDM</sub>, waiting for the serial communication wait time t<sub>IF</sub> noted in Section 3.4 to elapse, and then setting the slave select (SS) to logic level "L" (refer to Section 7.13. SPISel register has a default value of "0" : 4-wire SPI). I<sup>2</sup>C communication is enabled by setting the SS to logic level "H" (refer to Section 7.13. I<sup>2</sup>C\_EN register has a default value of "1" : I<sup>2</sup>C enable). 3-wire SPI communication is enabled by setting SPISel to "1" : 3-wire SPI and setting the SS to logic level "L". However, setting SPISel to "1" : 3-wire SPI will disable I<sup>2</sup>C communication.

When the 4-wire SPI with multi-slave function denoted in Section 6.4 is enabled via factory settings, the 4-wire SPI, 3-wire SPI and I<sup>2</sup>C functions mentioned in Section 6.1 through Section 6.3 cannot be used.

### 6.1. 4-Wire SPI

4-wire SPI communication is 8 bits width serial communication based on the SS, clock signal (SCLK), data input signal (MOSI), and data output signal (MISO). Set **SPISel** (register for selecting 4-wire SPI or 3-wire SPI) indicated in Section 7.13 to "0" (the default value is "0" : 4-wire SPI). To use 4-wire SPI communication, set I<sup>2</sup>C\_EN (register for enabling I<sup>2</sup>C) to "0" disable (default value is "1" : enable).

With falling edge of SS, the initial byte becomes the address. During serial data transfer, the SS must be maintained at logic level "L." If the SS is set to logic level "H," the serial data transfer will be canceled.

The initial address bit (MSB) is the write/read control bit. Set as "0" to write data to the register and set as "1" to read data from the register.

The subsequent bits 2 (A [6:5]) are the slave device (Gyro) address when the multi-slave function is enabled. Refer to Section 6.4 (4-wire SPI with multi-slave Function) and transfer the address of the slave device (Gyro) you want to access. Set to "00" when the multi-slave function is disabled.

Bits 5 (A <4:0>) on the LSB side of the address are the register address. Set the address of the register you want to access. The 2<sup>nd</sup> byte is the settings value for each register. Refer to the register map in Chapter 7 and transfer the values you want to set.

The register write sequence for 4-wire SPI is shown in Figure 6.1. Write data is transferred after the address. Maintain the SS at logic level "L" during the period between address and data transfer. During the write sequence, the MISO logic level is "L". X is "1" or "0".

Figure 6.1. Write Sequence for 4-Wire SPI

The register read sequence for 4-wire SPI is shown in Figure 6.2. After the address transfer is complete, data will simultaneously output with the SCLK falling edge beginning with the 2<sup>nd</sup> byte. Similar to the write sequence, during data non-output, the MISO logic level is "L". X is "1" or "0". Angular rate data reads are based on 16 bits output (or 24 bits output based on the angular rate data format selection indicated in Section 7.11). After reading the angular rate data from the 1<sup>st</sup> byte, maintain logic level "L" for the SS and continue clock input via the SCLK until the desired bit is read (the same applies to reading the temperature sensor data).

The sequence for only the address transfer (command) is shown in Figure 6.3. The register map indicated in Chapter 7 includes the items for only a partial address transfer (command). Similar to the register write sequence, set the first bit (MSB) of the address to "0". Bits 5 (A <4:0>) on the LSB side of the address are the register address (command). Set the address (command) you want to execute. After transferring the address (command), set the SS from logic level "L" to logic level "H" and end the serial communication. During the address transfer sequence, the MISO logic level is "L". X is "1" or "0".

Figure 6.2. Read Sequence for 4-Wire SPI

Figure 6.3. Address Setting Sequence for 4-Wire SPI

The timing diagrams for 4-wire SPI are indicated in Figure 6.4 and Figure 6.5.

Table 6.1. AC Characteristics for 4-Wire SPI

$V_{DDM} = 2.7\text{ V to }3.6\text{ V}$ ,  $GND = 0\text{ V}$ ,  $T_{OPR} = -20\text{ }^{\circ}\text{C to }+80\text{ }^{\circ}\text{C}$

Parameter	Symbol	Condition	$V_{DDI} \leq 2.4\text{ V}$			$V_{DDI} > 2.4\text{ V}$			Unit
			Min.	Typ.	Max.	Min.	Typ.	Max.	
SS setup time	$t_{SSS}$		15	-	-	15	-	-	ns

Output disable time	$t_{SOH}$		-	-	30	-	-	30	ns

Figure 6.4. Timing Diagram of Writing for 4-Wire SPI

Figure 6.5. Timing Diagram of Reading for 4-Wire SPI

(Note) X is "1" or "0".

**6.2. 3-Wire SPI**

The 3-wire SPI communication is 8 bits width serial communication based on the slave select signal (SS), the clock signal (SCLK), and the data input/output signal (MOSI). Set SPISel (register for selecting 3-wire SPI or 4-wire SPI) indicated in Table 7.8 to "1" (the default value is "0" : 4-wire SPI). Setting SPISel to "1" will disable the I<sup>2</sup>C communication.

Similar to 4-wire SPI, with the falling edge of SS the initial byte becomes the address. During serial data transfer, the SS must be maintained at logic level "L". If the SS is set to logic level "H", the serial data transfer will be canceled.

The initial address bit (MSB) is the write/read control bit. Set as "0" to write data to the register and set as "1" to read data from the register. Bits 5 (A <4:0>) on the LSB side of the address is the register address. Set the address of the register you want to access. The 2<sup>nd</sup> byte is the settings value for each register. Refer to the register map in Chapter 7 and transfer the values you want to set.

The register write sequence for 3-wire SPI is shown in Figure 6.6. Write data is transferred after the address. Maintain the SS at logic level "L" during the period between address and data transfer. X is "1" or "0".

The register read sequence for 3-wire SPI is shown in Figure 6.7. After the address transfer is complete, data is simultaneously outputted with the SCLK fall beginning from the 2<sup>nd</sup> byte. Angular rate data reads are based on 16 bits output (or 24 bits output based on the angular rate data format selection indicated in Section 7.11). After reading the angular rate data from the 1<sup>st</sup> byte, maintain the SS at logic level "L" and continue clock input via the SCLK until the desired bit is read. The same applies to read the temperature sensor data. X is "1" or "0".

**Figure 6.6. Write Sequence for 3-Wire SPI**

**Figure 6.7. Read Sequence for 3-Wire SPI**

The sequence for only the address transfer (command) is shown in Figure 6.8. The register map indicated in Chapter 7 includes the items for only a partial address transfer (command). Similar to the register write sequence, set the first bit (MSB) of the address to "0." Bits 5 (A<4:0>) on the LSB side of the address are the register address (command). Set the address (command) you want to execute. After transferring the address (command), set the SS from logic level "L" to logic level "H" and end the serial communication. X is "1" or "0."

Figure 6.8. Address Setting Sequence for 3-Wire SPI

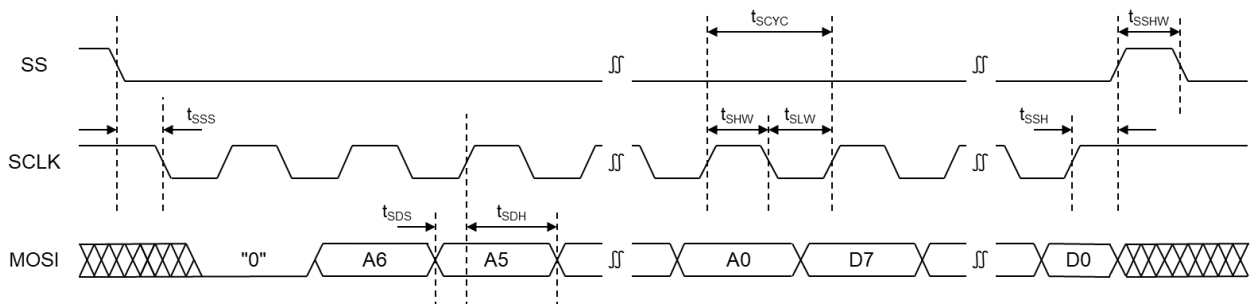

The timing diagrams for 3-wire SPI are indicated in Figure 6.9 and Figure 6.10.

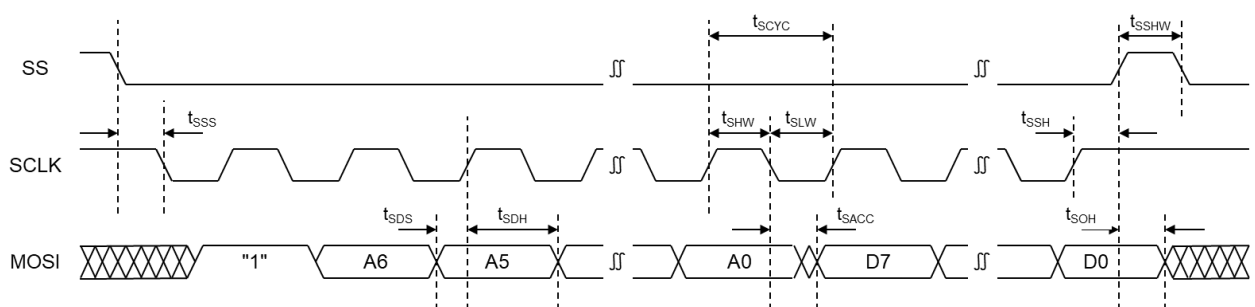

**Table 6.2. AC Characteristics for 3-Wire SPI**

$V_{DDM} = 2.7\text{ V to }3.6\text{ V}$ ,  $GND = 0\text{ V}$ ,  $T_{OPR} = -20\text{ }^{\circ}\text{C to }+80\text{ }^{\circ}\text{C}$

Parameter	Symbol	Condition	$V_{DDI} \leq 2.4\text{ V}$			$V_{DDI} > 2.4\text{ V}$			Unit
			Min.	Typ.	Max.	Min.	Typ.	Max.

**Figure 6.9. Timing Diagram of Writing for 3-Wire SPI**

**Figure 6.10. Timing Diagram of Reading for 3-Wire SPI**

(Note) X is "1" or "0".

6.3. I<sup>2</sup>C

I<sup>2</sup>C communication is 8 bits width serial communication based on the clock signal (SCL) and data address signal (SDA). Set I<sup>2</sup>C\_EN (register enabling for I<sup>2</sup>C) indicated in Table 7.8 to "1" (the default value is "1" : Enable). To use I<sup>2</sup>C communication, fix the slave select signal (SS) used in 4-wire or 3-wire SPI communication to logic level "H" (interface power supply voltage V<sub>DDI</sub>).

I<sup>2</sup>C communication is initiated by issuing the start condition (ST, with SCL status at logic level "H", SDA is changed from logic level "H" to logic level "L") from the master. And communication is stopped by issuing the stop condition (SP, with SCL status at logic level "H", SDA is changed from logic level "L" to logic level "H") from the master.

To access the internal register, read (Read = "1") /write (Write = "0") the slave device address (ADR, address that adds the SA0 "0" or "1" to "110101") to/from the master and transmit the total 1 byte that includes 1 bit ID signal. After ADR receipt, the slave will check to see if the address matches its own address. If matching, the slave returns an ACK (acknowledge), after which communication is possible. If the address does not match, the slave returns to idle mode and waits until another ST is issued.

The SA0 terminal is set to pull down internally (approx. 100 kΩ). If the SA0 terminal is set to "0," then connect to N.C. or GND. Or, if the SA0 terminal is set to "1", then connect to V<sub>DDI</sub>. In this case, a current of approximately 30 μA @ V<sub>DDI</sub> = 3 V will flow to the SA0 terminal. To reduce the current, add a desired resistor to the V<sub>DDI</sub> and the SA0 terminal. Alternatively, you can change the terminal setting from pull down to pull up by rewriting the SelMISO [1:0] indicated in Section 7.12 after turning the power ON and once the serial communication wait time t<sub>IF</sub> indicated in Section 3.4 has elapsed. Refer to Section 6.7 the MISO/SA0 Terminal Control Methods for details on control methods.

Next, send the internal register address (SUB-ADR). Input "0" for the first bit (MSB) of the address (there is not function allocation). The remaining LSB-side 7 bits (A <6:0> are the register address (for detail, refer to register map in Chapter 7). After transferring the address of the register you wish to access, return an ACK.

The following sequence differs between register write, register read, and address (command) transfer. Please refer to the sequences in Figure 6.11 through Figure 6.13.

Angular rate data reads are based on 16 bits output (or 24 bits output based on the angular rate data format selection indicated in Section 7.11). After reading the angular rate data from the 1<sup>st</sup> byte, set the master to return an ACK (acknowledge) instead of a NACK (non-acknowledge) and then read the 2<sup>nd</sup> byte or the 3<sup>rd</sup> byte. The same applies to read the temperature sensor data.

Figure 6.11. Write Protocol for I<sup>2</sup>C

Figure 6.12. Read Protocol for I<sup>2</sup>C

Figure 6.13. Address Setting Protocol for I<sup>2</sup>C

- ST : Start condition
- SP : Stop condition
- ADR : Slave device address (110101 + SA0)
- R/W : Read = "1", Write = "0"
- SUB-ADR : Internal register address
- DATA : Internal register read/write data
- ACK : "Low"
- NACK : "High", send at read complete.

As an example of a waveform, register write, register read, and address setting sequence are shown in Figure 6.14 through Figure 6.16.

Between STOP and START condition	$t_{WS}$	1.3	-	-	$\mu\text{s}$

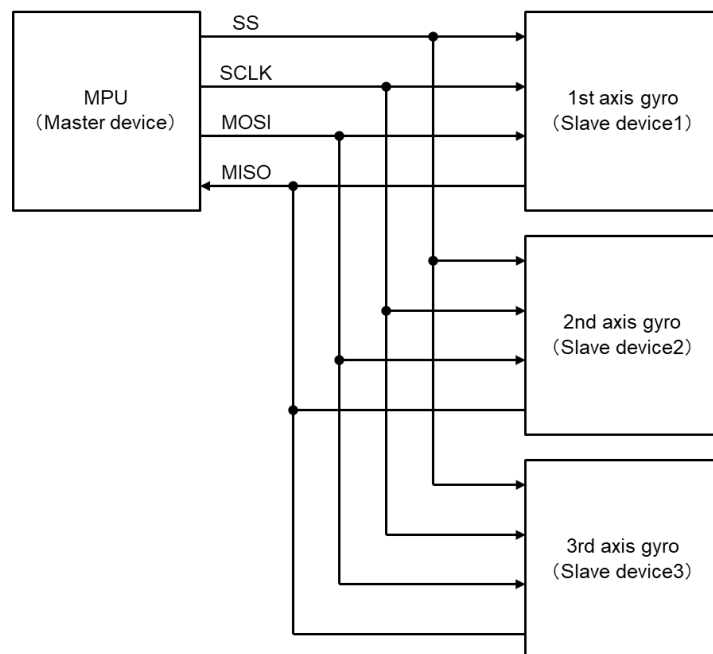

**Figure 6.17. Timing Diagram for I<sup>2</sup>C**

**6.4. 4-Wire SPI with Multi-Slave Function**

The multi-slave function is an extended function of 4-wire SPI mode that is available only through factory settings implemented by Epson. The multi-slave function allows you to reduce I/O ports and board circuitry by connecting multiple (maximum of 3) slave devices (Gyro) to a single master device (MPU). When the multi-slave function is enabled via factory settings, other serial communication (4-wire SPI, 3-wire SPI, and I<sup>2</sup>C) cannot be used.

A connection example using 3 slave devices is shown in Figure 6.18. Three slave devices (Gyro) share a serial communications port connection on a single master device (MPU).

Each slave device (Gyro) is assigned the respective address shown in Table 6.4. Setting the address A [6:5] indicated in Section 6.1 enables serial communication with the desired slave device.

**Figure 6.18. Connection Examples**

**Table 6.4. Slave Device Addresses and Product Name**

A [6]	A [5]	Selected slave device	Product name
0	0	All slave devices	-
0	1	1 <sup>st</sup> axis Gyro	XV7081BB 49.600kHz C
1	0	2 <sup>nd</sup> axis Gyro	XV7081BB 51.000kHz D
1	1	3 <sup>rd</sup> axis Gyro	XV7081BB 53.600kHz E

(Note) When the maximum 3 slave devices are connected.

Furthermore, when the address A [6:5] is set to "00", a register write command will write the same data to all slave devices, but register read commands are not common to all devices. Even if the read/write control bit (first bit of address: MSB) indicated in Section 6.1 is mistakenly set to "1" (read), the MISO value is "High-Z" (excluding global angular rate reads).

The register write sequence when using the multi-slave function is shown in Figure 6.19. Write data is transferred after the slave device address and register address. Maintain the SS at logic level "L" during the period between address and data transfer. During the write sequence, the MISO value is "High-Z". X is "1" or "0".

The register read sequence when using the multi-slave function is shown in Figure 6.20. After the slave device address and register address transfer is complete, data is simultaneously outputted with falling edge of SCLK and beginning from the 2<sup>nd</sup> byte. Similar to the write sequence, during data non-output, the MISO setting is "High-Z". X is "1" or "0". Angular rate data reads are based on 16 bits output (or 24 bits output based on the angular rate data format selection indicated in Section 7.11). After reading the angular rate data from the 1<sup>st</sup> byte, maintain logic level "L" for the SS and continue clock input via the SCLK until the desired bit is read (the same applies to read the temperature sensor data).

The sequence for only the address transfer (command) via the multi-slave function is shown in Figure 6.21. Maintain the SS at logic level "L" during address transfer. During the address transfer sequence, the MISO value is "High-Z". X is "1" or "0".

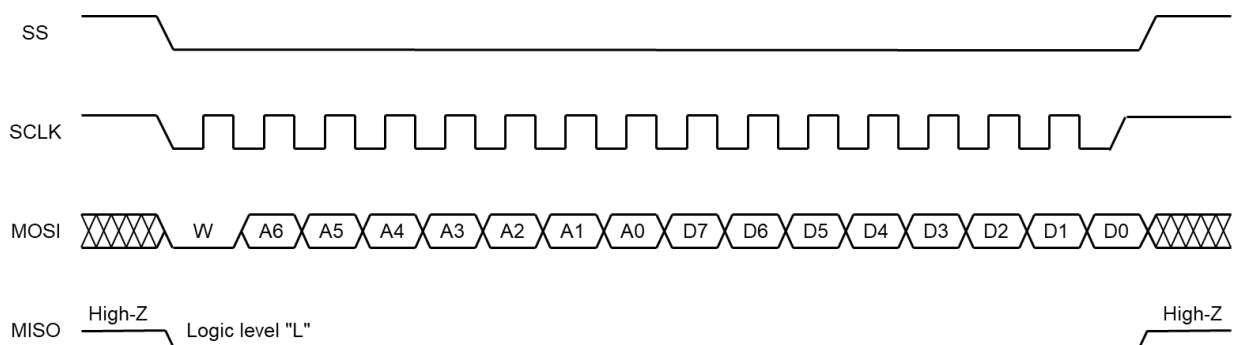

Figure 6.19. Write Sequence for 4-Wire SPI with Multi-Slave Function

(Note) X is "1" or "0".

### 6.5. Angular Rate Data Read

#### 6.5.1. 4-Wire SPI, 3-Wire SPI and I<sup>2</sup>C (Multi-Slave Function Disabled)

The angular rate read function is conducted using the DatAccOn indicated in Table 7.1. Angular rate data uses the 2's compliment expression and has a data width of 16 bits or 24 bits (switch using the DataFormat indicated in Table 7.6). During serial communication, after reading the angular rate data from the 1st byte, maintain logic level "L" for the SS and continue clock input via the SCLK until the desired bit is read.

When in 4-wire SPI or 3-wire SPI communication mode, after reading the angular rate data from the 1<sup>st</sup> byte, maintain logic level "L" for the SS and continue clock input via the SCLK until the desired bit is read.

When in I<sup>2</sup>C communication mode, after reading the angular rate data from the 1<sup>st</sup> byte, set the master to return an ACK (acknowledge) instead of a NACK (non-acknowledge) and then read the 2<sup>nd</sup> byte or the 3<sup>rd</sup> byte.

**Table 6.6. Angular Rate Data Output Control**

A [6:5]	DataFormat	Data output order		
		1 <sup>st</sup> byte	2 <sup>nd</sup> byte	3 <sup>rd</sup> byte
00	0	D [15:8]	D [7:0]	/
00	1	D [23:16]	D [15:8]	D [7:0]

(Note) DataFormat is the angular rate data format indicated in Table 7.6.

**Figure 6.24. Angular Rate Data (16 Bits Output)**

**Figure 6.25. Angular Rate Data (24 Bits Output)**

#### 6.5.2. 4-Wire SPI with Multi-Slave Function

The angular rate read function is conducted using the DatAccOn indicated in Table 7.1. Angular rate data uses the 2's compliment expression and has a data width of 16 bits or 24 bits (switch using the DataFormat indicated in Table 7.6). There are two reading methods, Global angular rate read and Normal angular rate read.

Global angular rate read is shown in Figure 6.26. This reading method is available only when 3 slave devices are connected. To conduct a global angular rate read, set the slave device address A [6:5] to "00". After the angular rate data for the 1<sup>st</sup> axis gyro, the angular rates for the 2<sup>nd</sup> gyro and then the 3<sup>rd</sup> gyro are output. During serial communication, maintain logic level "L" for the SS and continue clock input via the SCLK until the desired bit is read. If the logic level for the SS is changed from "L" to "H" before the desired bit is read, then no further angular rate data is outputted. Redo the angular rate data read command (DatAccOn).

If the SCLK is stopped with the SS level maintained at level "L" before the desired bit is read, the angular rate data read can be outputted by restarting the SCLK input.

Global angular rate read operation method 1 is shown in Figure 6.27. After the angular rate data for the 1<sup>st</sup> axis gyro, the angular rates for the 2<sup>nd</sup> gyro and then the 3<sup>rd</sup> gyro are output. After the desired bit is read, raise the SS from logic level "L" to logic level "H." Run the angular rate data read command (DatAccOn) to read the angular rate data again.

Figure 6.26. Global Angular Rate Read

Figure 6.27. Global Angular Rate Read Operation Method 1

Global angular rate read operation method 2 is shown in Figure 6.28. The data output order is shown in Table 6.7. After the angular rate data for the 3rd axis gyro is output, input the SCLK with the SS logic level at "L" to output the 2<sup>nd</sup> order angular rate data (1<sup>st</sup> – 3<sup>rd</sup>gyro). This angular rate data read can be repeated in the order of 3<sup>rd</sup>, 4<sup>th</sup> until the SS logic level is set to "H".

The read angular rate data update is conducted during the read period for the lower 8 bits of the angular rate data of the previous axis (ex: the angular rate data for 1<sup>st</sup> axis gyro of the 2<sup>nd</sup> order is updated during the read period for the lower 8 bits of angular rate data from the 3<sup>rd</sup> axis gyro of the 1<sup>st</sup> order).

Normal angular rate read is shown in Figure 6.29. For the slave device address A [6:5] used during normal angular rate read, set a desired slave device address (any of the Gyro addresses for the 1<sup>st</sup> through 3<sup>rd</sup> axes) from the addresses indicated in Table 6.4. During serial communication, maintain logic level "L" for the SS and continue clock input via the SCLK until the desired bit is read. If the logic level for the SS is changed from "L" to "H" before the desired bit is read, then no further angular rate data is output. Redo the angular rate data read command (DatAccOn).

If the SCLK is stopped with the SS logic level maintained at "L" before the desired bit is read, the angular rate data output can be continued by restarting the SCLK input.

After all angular rate data is provided, any angular rate data won't be provided even if the SCLK is sent with the SS logic level maintained at "L" (MISO keeps outputting at logic level "L"). To read angular rate data again, set the SS logic level to "H" (MISO is set to "High-Z") and execute the angular rate data read command (DatAccOn) again.

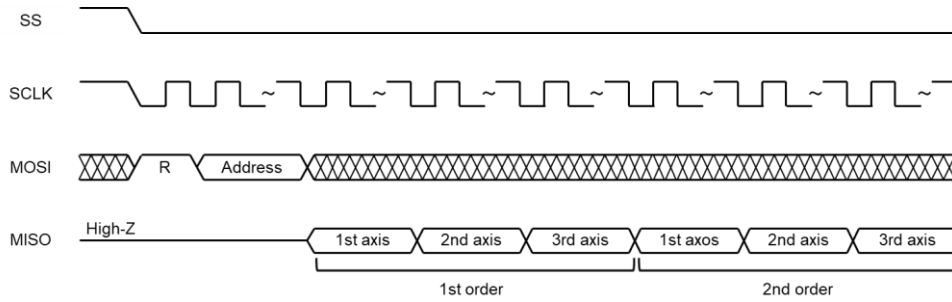

Figure 6.28. Global Angular Rate Read Operation Method 2

Table 6.7. Global Angular Rate Read Operation Method 2 – (Data Output Order)

Epson factory settings	Data output order					
Multi-slave function	1 <sup>st</sup> order			2 <sup>nd</sup> order		
	1 <sup>st</sup> axis gyro	2 <sup>nd</sup> axis gyro	3 <sup>rd</sup> axis gyro	1 <sup>st</sup> axis gyro	2 <sup>nd</sup> axis gyro	3 <sup>rd</sup> axis gyro

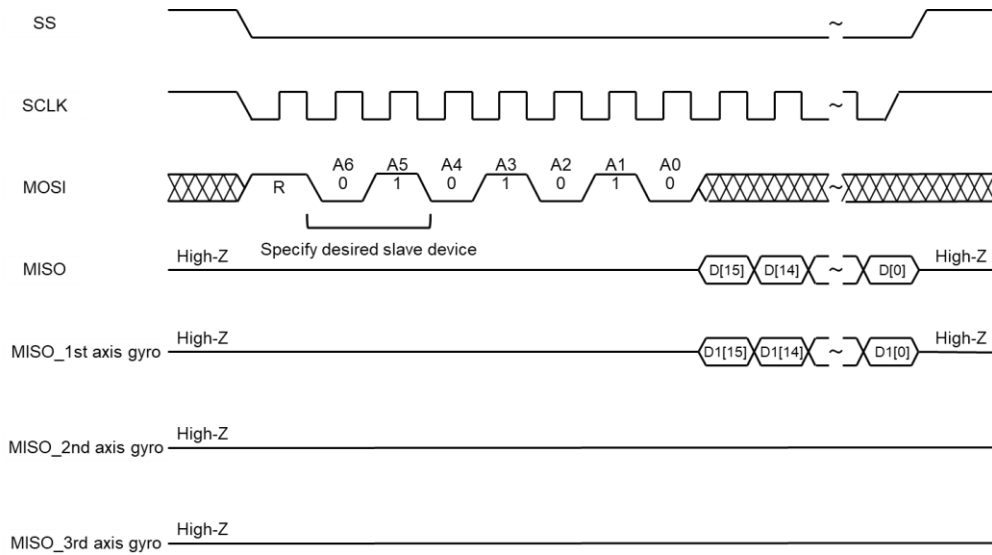

Figure 6.29. Normal Angular Rate Read

The angular rate data output control for both global angular rate read and normal angular rate read are indicated in Table 6.8.

**Table 6.8. Angular Rate Data Output Control**

Read method	A [6:5]	Data Format	Data output order								
			1 <sup>st</sup> byte	2 <sup>nd</sup> byte	3 <sup>rd</sup> byte	4 <sup>th</sup> byte	5 <sup>th</sup> byte	6 <sup>th</sup> byte	7 <sup>th</sup> byte	8 <sup>th</sup> byte	9 <sup>th</sup> byte
Global angular rate read	00	0	D1 [15:8]	D1 [7:0]	D2 [15:8]	D2 [7:0]	D3 [15:8]	D3 [7:0]	/	/	/
		1	D1 [23:16]	D1 [15:8]	D1 [7:0]	D2 [23:16]	D2 [15:8]	D2 [7:0]	D3 [23:16]	D3 [15:8]	D3 [7:0]
Normal angular rate read	Other than 00	0	D [15:8]	D [7:0]	/	/	/	/	/	/	/
		1	D [23:16]	D [15:8]	D [7:0]	/	/	/	/	/	/

- (Note 1) The address A [6:5] is the slave device address indicated in Table 6.4.
- (Note 2) DataFormat is the angular rate data format (DataFormat = 0: 16 bits output/1: 24 bits output) indicated in Table 7.6.
- (Note 3) D1 is the angular rate data for the 1<sup>st</sup> axis gyro, D2 is the angular rate data for the 2<sup>nd</sup> axis gyro, and D3 is the angular rate data for the 3<sup>rd</sup> axis gyro.
- (Note 4) D is the angular rate data for the slave device (any of the 1<sup>st</sup> through 3<sup>rd</sup> axis gyro) specified with the address A [6:5].
- (Note 5) With global angular rate read, all slave devices are selected. After D1, the angular rate data for the 1<sup>st</sup> axis gyro, the angular rate data for D2 and D3 are output. Mistakenly specifying a separate angular rate data format (DataFormat = 0: 16 bits output/1: 24 bits output) for each slave device will result in a conflict in the output angular rate data. As such, make sure the angular rate data format setting is the same for each slave device.  
 Ex: In the case of 1<sup>st</sup> axis gyro DataFormat = 1 (24 bits output) and 2<sup>nd</sup> axis gyro DataFormat = 0 (16 bits output), the angular rate data output in the 3<sup>rd</sup> byte will result in a conflict.
- (Note 6) Global angular rate read (address A [6:5] = "00") can be repeated in the order of 2<sup>nd</sup>, 3<sup>rd</sup> until the SS logic level is set to "H".
- (Note 7) During the global angular rate read (address A [6:5] = "00"), if there is no slave device on a certain axis, then the angular rate data for that axis is set to "High-Z".

**6.6. Angular Rate Data Read**

The temperature sensor data read is conducted using the TempRd indicated in Table 7.1. Temperature sensor data uses the 2's compliment expression and has a data width of 8 bits, 10 bits or 12 bits (switch using the TsDataFormat indicated in Table 7.7, the default value is 12 bits). Similar to the angular rate data read function, continue the serial communication until the desired bit is read. Temperature sensor data is updated in intervals of approximately 2.4 ms.

**Table 6.9. Temperature Sensor Data Output Control**

TsDataFormat [1]	TsDataFormat [0]	Data output order	
		1 <sup>st</sup> byte	2 <sup>nd</sup> byte
0	0	D [7:0]	/
0	1	D [9:2]	D [1:0] (Note 1)
1	0	D [11:4]	D [3:0] (Note 2)
1	1	/	/

- (Note 1) Logic level "L" is outputted at LSB-side 6 bits.
- (Note 2) Logic level "L" is outputted at LSB-side 4 bits.

**6.7. Control MISO/SA0**

MISO/SA0 terminal status as indicated in Table 6.10 can be changed by rewriting SeIMISO [1:0] indicated in Section 7.13.

**Table 6.10. MISO/SA0 Terminal Control Method**

Mode	SPISel	I <sup>2</sup> C_EN	SeIMISO [1]	SeIMISO [0]	SS	MISO/SA0
Multi-slave	X	X	X	X	0	Output (Note 2)
	X	X	X	X	1	High-Z
4-wire SPI	0 (4-wire)	0 (I <sup>2</sup> C Disable)	X	X	0	Output
	0	0	0	0	1	Output Level "L"
	0	0	0	1	1	Output Level "H"
	0	0	1	X	1	High-Z
3-wire SPI	1 (3-wire)	X	0	0	X	Output Level "L"
	1	X	0	1	X	Output Level "H"
	1	X	1	X	X	High-Z
I <sup>2</sup> C	0	1 (I <sup>2</sup> C Enable)	0	0	1	Input
	0	1	0	1	1	High-Z (Note 3)
	0	1	1	0	1	Input (pull-down)
	0	1	1	1	1	Input (pull-up)

(Note 1) The default value for SeIMISO [1] is "1" and "0" for SeIMISO [0].

(Note 2) The status is outputted during data read, "High-Z" during other times.

(Note 3) SA0 is fixed at "0" within the IC.

**6.8. Command Validation Time**

**6.8.1. 4-Wire SPI, 3-Wire SPI and 4-Wire SPI with Multi-Slave Function**

**Table 6.11. Command Validation Time for SPIs**

V<sub>DDM</sub> = 2.7 V to 3.6 V, GND = 0 V, T<sub>OPR</sub> = -20 °C to +80 °C

Parameter	Symbol	Min.	Typ.	Max.	Unit
Sleep-in wait time	t <sub>SLPIN</sub>	10	-	-	μs
Sleep-out wait time (Note 1)	t <sub>SLPOUT</sub>	10	-	-	μs
Standby wait time	t <sub>STBY</sub>	10	-	-	μs
Software reset wait time	t <sub>SWRST</sub>	10	-	-	μs

6.8.2. I<sup>2</sup>C

Table 6.12. Command Validation Time for I<sup>2</sup>C

V<sub>DDM</sub> = 2.7 to 3.6 V, GND = 0 V, T<sub>OPR</sub> = -20 °C to +80 °C

Parameter	Symbol	Min.	Typ.	Max.	Unit
Sleep-in wait time	t <sub>SLPIN</sub>	10	-	-	μs
Sleep-out wait time (Note 1)	t <sub>SLPOUT</sub>	10	-	-	μs
Standby wait time	t <sub>STBY</sub>	10	-	-	μs
Software reset wait time	t <sub>SWRST</sub>	10	-	-	μs

Figure 6.31. Command Validation Time for I<sup>2</sup>C

(Note 1) Sleep-out command is validated after Sleep-in or Standby command issued and wait for t<sub>SLPOUT</sub> or t<sub>STBY</sub> to elapse.

## 7. User Command Register

Table 7.1. User Command Register

Address	Register	R/W	Function
0x00	Reserved		
0x01	DspCtl1	R/W	DSP settings 1
0x02	DspCtl2	R/W	DSP settings 2
0x03	DspCtl3	R/W	DSP settings 3
0x04	StsRd	R	Status read
0x05	SlpIn	C	Sleep-in
0x06	SlpOut	C	Sleep-out
0x07	Stby	C	Standby
0x08	TempRd	R	Temperature sensor data read
0x09	SWRst	C	Software reset (user command register reset)

	1	SelfFs [1]	0	R/W		
	0	SelfFs [0]	0	R/W		

(Note 1) Reserved register must not be changed. Use the default settings.

(Note 2) The  $f_s$  is the AD converter sample rate. It carries out down sampling of the angular rate output.

7.4. Status Read

Table 7.5. Status Read

Address	Bit	Register	Default	R/W	Function	Settings
0x04	7	Reserved		R	Reserved	Reserved
	6	Reserved		R	Reserved	Reserved
	5	Reserved		R	Reserved	Reserved
	4	Reserved		R	Reserved	Reserved
	3	ProcOK		R	Temperature sensor data output flag	0: Data output not available 1: Data output available
	2	preStsPOR		R	Status flag	Bit [2:0] (Note 1) 100: After turning power ON 010: Standby 000: Sleep 001: Sleep out
	1	preStsStby		R		
	0	preStsSlpOut		R		

(Note 1) Reserved register must not be changed. Use the default settings.

(Note 2) Only indicated combinations allowed.

**7.5. Sleep-In**

Specify address as "0x05". No data read or write. During sleep, only register access is possible. Status for angular rate data and temperature sensor data is "0". Conduct the sleep-out command in Section 7.6 to disable sleep mode.

**7.6. Sleep-Out**

Specify address as "0x06". No data read or write. Returns to normal operations from sleep mode or standby mode. This resets the DSP.

**7.7. Standby**

Specify address as "0x07". No data read or write. During standby, the detection circuit is set to disable. Status for angular rate data and temperature sensor data is "0". Conduct the sleep-out command in Section 7.6 to disable standby mode.

However, you cannot transition from sleep mode to standby mode.

**7.8. Temperature Sensor Data Read**

Specify address as "0x08". Only data read (no data write). Refer to Section 6.6 regarding the temperature sensor data read function.

**7.9. Software Reset**

Specify address as "0x09". No data read or write. The user command register indicated in Table 7.1 is reset (set to the default value).

**7.10. Angular Rate Data Read**

Specify address as "0x0a". Only data read (no data write). Refer to Section 6.5 regarding the angular rate data read function.

**7.11. Angular Rate Data Read Control****Table 7.6. Angular Rate Data Read Control**

Address	Bit	Register	Default	R/W	Function	Settings
0x0b	7	Reserved	0	R	Reserved	Reserved
	6	Reserved	0	R	Reserved	Reserved
	5	Reserved	0	R/W	Reserved	Reserved
	4	Reserved	0	R/W	Reserved	Reserved
	3	Reserved	0	R/W	Reserved	Reserved
	2	DataFormat	0	R/W	Angular rate data format	0: 16 bits output 1: 24 bits output
	1	Reserved	0	R/W	Reserved	Reserved
	0	Reserved	1	R/W	Reserved	Reserved

(Note) Reserved register must not be changed. Use the default settings.

7.12. Temperature Sensor Data Format

Table 7.7. Temperature Sensor Data Format

Address	Bit	Register	Default	R/W	Function	Settings
0x1c	7	Reserved	0	R	Reserved	Reserved
	6	TsDataFormat [1]	1	R/W	Temperature sensor data format	TsDataFormat [1:0] 00: 8 bits output 01: 10 bits output 10: 12 bits output 11: Not Available
	5	TsDataFormat [0]	0	R/W		
	4	Reserved	0	R/W	Reserved	Reserved
	3	SeIMISO [1]	1	R/W	MISO/SA0 terminal status selection	(Note 2)
	2	SeIMISO [0]	0	R/W		
	1	Reserved	1	R/W	Reserved	Reserved
	0	Reserved	1	R/W	Reserved	Reserved

(Note 1) Reserved register must not be changed. Use the default settings.

(Note 2) Refer to Section 6.7 indicated in Chapter 6 for details on settings.

7.13. Serial Interface Settings

Table 7.8. Serial Interface Settings

Address	Bit	Register	Default	R/W	Function	Settings
0x1f	7	Reserved	0	R	Reserved	Reserved
	6	Reserved	0	R	Reserved	Reserved
	5	Reserved	0	R	Reserved	Reserved
	4	Reserved	0	R	Reserved	Reserved
	3	Reserved	0	R	Reserved	Reserved
	2	Reserved	0	R	Reserved	Reserved
	1	SPISel (Note 3)	0	R/W	4-wire/3-wire SPI select	0: 4-wire SPI, 1: 3-wire SPI
	0	I <sup>2</sup> C_EN (Note 3)	1	R/W	I <sup>2</sup> C enable	0: Disable, 1: Enable

(Note 1) The mode indicated in Table 7.8 can be changed only by SPI communication.

(Note 2) Reserved register must not be changed. Use the default settings.

(Note 3) Register settings are not set when the multi-slave function is enabled via factory settings.

## 8. Filter Characteristics

### 8.1. Analog Filter

The analog low-pass filter (LPF) with 1<sup>st</sup> order characteristic indicated in Figure 1.2 is shown in Table 8.1.

**Table 8.1. Analog LPF**

Parameter	Condition	Min.	Typ.	Max.	Unit
Cut-off frequency	At phase delay 45 °		1370		Hz
Phase delay	Phase delay angle at 10 Hz		-0.42		°

(a) Gain

(b) Phase

(c) Group delay

**Figure 8.1 Filter characteristics of the analog LPF**

8.2. Digital Filter

Filter (LPF)

8.2.1. Selectable Digital Low-Pass The typical charac

teristic values of the selectable digital LPF are shown in Table 8.2, and the filter characteristics are shown in Figure 8.2 to Figure 8.4. The digital LPF has selectable filter orders (2nd, 3rd and 4th order) and cutoff frequencies (10 Hz to 500 Hz, 14 steps). See Section 7.2 for the setting instructions. For more details on the filter characteristics, please contact us.

Table 8.2. Selectable Digital LPF

Parameter	Condition	Typ.			Unit
		2 <sup>nd</sup> order	3 <sup>rd</sup> order	4 <sup>th</sup> order	
Phase delay @ 10 Hz	f <sub>c</sub> = 10 Hz	-67.3	-83.2	-96.6	°
	f <sub>c</sub> = 35 Hz	-21.4	-25.5	-29.1	°
	f <sub>c</sub> = 45 Hz	-16.7	-19.8	-22.6	°
	f <sub>c</sub> = 50 Hz	-15.0	-17.9	-20.4	°
	f <sub>c</sub> = 70 Hz	-10.8	-12.8	-14.5	°
	f <sub>c</sub> = 85 Hz	-8.9	-10.5	-12.0	°
	f <sub>c</sub> = 100 Hz	-7.6	-9.0	-10.2	°
	f <sub>c</sub> = 140 Hz	-5.4	-6.4	-7.3	°
	f <sub>c</sub> = 175 Hz	-4.3	-5.1	-5.8	°
	f <sub>c</sub> = 200 Hz	-3.8	-4.5	-5.1	°
	f <sub>c</sub> = 285 Hz	-2.6	-3.1	-3.6	°
	f <sub>c</sub> = 345 Hz	-2.2	-2.6	-2.9	°
	f <sub>c</sub> = 400 Hz	-1.9	-2.2	-2.5	°
	f <sub>c</sub> = 500 Hz	-1.5	-1.8	-2.0	°
Group delay @ DC	f <sub>c</sub> = 10 Hz	20.9	24.7	28.1	ms
	f <sub>c</sub> = 35 Hz	6.0	7.1	8.1	ms
	f <sub>c</sub> = 45 Hz	4.7	5.6	6.3	ms
	f <sub>c</sub> = 50 Hz	4.2	5.0	5.7	ms
	f <sub>c</sub> = 70 Hz	3.1	3.6	4.1	ms
	f <sub>c</sub> = 85 Hz	2.6	3.0	3.4	ms
	f <sub>c</sub> = 100 Hz	2.2	2.6	2.9	ms
	f <sub>c</sub> = 140 Hz	1.6	1.9	2.1	ms
	f <sub>c</sub> = 175 Hz	1.3	1.5	1.7	ms
	f <sub>c</sub> = 200 Hz	1.2	1.4	1.5	ms
	f <sub>c</sub> = 285 Hz	0.9	1.0	1.1	ms
	f <sub>c</sub> = 345 Hz	0.7	0.8	0.9	ms
	f <sub>c</sub> = 400 Hz	0.6	0.7	0.8	ms
	f <sub>c</sub> = 500 Hz	0.5	0.6	0.7	ms

Figure 8.2 Filter characteristics of the selectable digital LPF (2<sup>nd</sup> order)

Figure 8.3 Filter characteristics of the selectable digital LPF (3<sup>rd</sup> order)

Figure 8.4 Filter characteristics of the selectable digital LPF (4<sup>th</sup> order)

8.2.2. Selectable Digital High-Pass Filter (HPF)

Table 8.3. Selectable Digital HPF

Parameter	Condition		Typ.	Unit
	HpfFc [2:0]	$f_c$	1 <sup>st</sup> order	
Phase@ 10 Hz	000	0.01 Hz	0.1	°
	001	0.03 Hz	0.2	°
	010	0.1 Hz	0.6	°
	011	0.3 Hz	1.7	°
	100	1 Hz	5.7	°
	101	3 Hz	16.7	°
	110	10 Hz	45.0	°
Group delay @ 10 Hz	000	0.01 Hz	0.02	ms
	001	0.03 Hz	0.05	ms
	010	0.1 Hz	0.16	ms
	011	0.3 Hz	0.47	ms
	100	1 Hz	1.56	ms
	101	3 Hz	4.35	ms
	110	10 Hz	7.92	ms

10. Other Information

10.1. Moisture Sensitivity Level (MSL)

Table 10.1. MSL

Parameter	Level	Standard
MSL	1	JEDEC J-SD-020D.01

10.2. Electro-Static Discharge (ESD)

Table 10.2. ESD

Model	Min.	Standard & Condition
HBM	2000 V	JESD22-A114, V <sub>DDM</sub> , V <sub>DDI</sub> and GND reference, 3 times
MM	200 V	JESD22-A115, V <sub>DDM</sub> , V <sub>DDI</sub> and GND reference, 1 time

10.3. Soldering Profile

A solder heat resistance of this product was verified under the air reflow soldering profile (JEDEC J-STD-020D.1) shown Figure 10.1.

Figure 10.1. Soldering Profile

### 11. Taping Information

#### 11.1. Taping Quantity

The standard quantity in a reel is 2000 pcs.

#### 11.2. Taping Specification

Subject to EIA-481, IEC 60286, JIS C0806

Table 11.1. Tape and Reel Materials

Item	Material
Carrier tape	Black conductive PS (polystyrene)
Top tape	Antistatic PET (polyethylene terephthalate)
Reel	Black conductive PS

#### 11.3. Taping Dimensions

Figure 11.1. Tape Dimensions

#### 11.4. Reel Dimensions

Figure 11.2. Reel Dimensions

## 12. Terminology

### 12.1. Cross Axis Sensitivity

The value is derived by dividing sensitivity around the X and Y axis by the sensitivity around the Z axis. The X, Y, and Z axis directions are as shown in Figure 12.1.

Figure 12.1. Each Axis Direction

### 12.2. Drive Frequency

The drive frequency is the resonance frequency (drive mode) of the sensor element continuously vibrated to gain the Coriolis force.

### 12.3. Detuning Frequency

The detuning frequency is the natural frequency used for the mechanical-electrical transduction of the Coriolis force. It is the difference from the drive frequency.

## 13. Handling Precaution

Crystal devices are high precision products. Use the following precautions during handling.

1. The detuning frequency for this product is  $900 \text{ Hz} \pm 200 \text{ Hz}$ . During board design, the customer must ensure that the board resonance frequency is not within the vicinity of this detuning frequency. When mounting on a board, align the sensor near a board loading component with low resonance variation.
2. Excessive shock from adsorption/chucking when mounting the sensor or excessive vibration or shock during board cutting or an impact wrench after mounting can result in damage to the sensor or the deterioration of sensor properties. Establish conditions that avoid vibration or shock to the sensor to ensure there is not loss in performance.
3. To detect angular rate, this product uses a drive frequency to drive the sensor element. External application of a signal with frequency components in the vicinity of the drive frequency or high-order harmonics can result in fluctuations in angular rate output by the sensor. Be sure to confirm internally in advance concerning power supply decoupling measures and serial interface communications frequency settings.
4. To prevent malfunctions caused by electromagnetic induction and static induction from other signal lines, during pattern design do not pass other signal lines near the sensor or along the back of the package. Also, use a pattern design that does not cross with other signal lines.
5. It may occur communication error with the device due to the signal pattern of board. In that case, please connect dumping resistor to reduce noise/overshoot/undershoot of the signal.
6. Confirm internally in advance concerning measures for vibration, shock, and noise.
7. This product design incorporates shock resistance but there is the risk of product damage due to drops and shock. **Do not use this product if it has been dropped as we cannot guarantee product performance.**
8. Applying ultrasonic vibration during ultrasonic washing can cause resonance damage to the crystal unit depending on usage conditions. As we cannot specify the usage conditions (washer type, power, time, tub position, etc.) at your company, we offer no guarantees concerning operability after the application of ultrasonic vibration. Confirm internally prior to use if the use of ultrasonic washing is required.
9. Prior to use, conduct mounting tests internally to confirm there is no impact on performance. Similarly, confirm prior to changing any conditions. During and after mounting, ensure that the sensor is not in contact with boards or structural elements.
10. The sensor includes a static electricity protection circuit, but application of significant static electricity can result in damage to the sensor's internal IC. Make sure to use conductive materials for packaging and transport containers as well. For the soldering iron, measurement circuit, etc., use products with no high-voltage leaks and during mounting make sure to employ static electricity measures such as the use of a ground wire.
11. Keep reflow to no more than three times. Use a soldering iron to correct any soldering mistakes. Here, the temperature of the iron type should be below  $+350 \text{ }^{\circ}\text{C}$  and less than 3 seconds. (Blower use not allowed)
12. We recommend using board production based on Epson pad dimensions.
13. This product has the same frequency noise as drive frequency. Remove using an appropriate filter circuit.
14. This product is designed to resist acoustic interference even when multiple sensors are operated in close proximity but impedance common to board resonance and power supply could result in mechanical or electrical interference. Confirm internally prior to use.
15. This product includes a POR circuit. To avoid the POR circuit malfunctions, power supply voltage rise should be conducted between 0.01 ms and 100 ms.
16. Do not use in high condensation or other environments prone to short circuits between terminals.
17. Using the drive frequency integral multiplier as communications clock may result in fluctuations in the angular rate output.
18. Acquiring angular rate data as a frequency that is a fraction of the integer for the drive frequency can result in fluctuations in the angular rate output.
